Air filter C 25 024 with half-moon-sealing

The MANN-FILTER air filter C 25 024 for SCANIA truck applications now has a sealing lip, also called half-moon-sealing.

What is the purpose of the sealing lip?

Ideal sealing

The most striking feature of the new air filter is the sealing lip at the lower end plate of the C 25 024 (image 1) for sealing the housing. The upside-down mounted air filter closes this opening (image 2), also called dirt discharge opening, at the bottom of the housing. The air filter system stays sealed in operating state by this patent registered connection between the end plate and the housing.

Uncomplicated cleaning

If the filter housing is so badly soiled that it needs to be rinsed with water, the impurities can simply drain through the dirt discharge opening.

Easy Servicing

The correct position of the filter can easily be found because the sealing lip fits perfectly to the opening in the housing.

It is inserted with the help of a mechanical guide to ensure that it is securely seated in the correct position. The filter is installed upside-down.
